

## PHP NOTES

### Hello world program

```
<?php  
echo "Hello World!";  
?>
```

---

### Working of Conditions in php

```
<?php if ($expression == true): ?>  
    This HTML statement will be rendered.  
<?php else: ?>  
    Otherwise this HTML statement will be rendered.  
<?php endif; ?>
```

---

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
<?php  
$color = "red";  
echo "My car is " . $color . "<br>";  
echo "My house is " . $COLOR . "<br>";  
echo "My boat is " . $coLOR . "<br>";  
?>
```

```
</body>
```

```
</html>
```

---

The `+ 15` part will be ignored in the calculation:

```
$x = 5 /* + 15 */ + 5;  
echo $x;
```

---

The `var_dump()` function returns the data type and the value:

---

```
echo "<h2>PHP is Fun!</h2>";
echo "Hello world!<br>";
echo "I'm about to learn PHP!<br>";
echo "This ", "string ", "was ", "made ", "with multiple parameters.";
```

---

```
<?php
$cars = array("Volvo","BMW","Toyota");
var_dump($cars);
?>
```

---

## PHP Object

```
class Car {
    public $color;
    public $model;
    public function __construct($color, $model) {
        $this->color = $color;
        $this->model = $model;
    }
    public function message() {
        return "My car is a " . $this->color . " " . $this->model . "!";
    }
}
```

```
$myCar = new Car("red", "Volvo");
var_dump($myCar);
```

---

The PHP `explode()` function splits a string into an array.

```
$x = "Hello World!";  
$y = explode(" ", $x);
```

```
//Use the print_r() function to display the result:  
print_r($y);
```

---

Start the slice at index 6 and end the slice 5 positions later:

```
$x = "Hello World!";  
echo substr($x, 6, 5);
```

---

## Negative Length

Use negative *length* to specify how many characters to omit, starting from the end of the string:

### Example

From the string "Hi, how are you?", get the characters starting from index 5, and continue until you reach the 3. character from the end (index -3).

Should end up with "ow are y":

```
$x = "Hi, how are you?";  
echo substr($x, 5, -3);
```

---

## API USING PHP

### Fetch data from database using api in php

```
<?php
$con=mysqli_connect("localhost","root","","API_DATA");
$response=array();
if($con)
{
    //echo "DB Connected";
    $sql= "select * from data";
    $result = mysqli_query($con,$sql);
    If($result)
    {
        $i=0;
        while($row= mysqli_fetch_assoc($result))
        {
            $response[$i]['id']=$row['id'];
            $response[$i]['name']=$row['name'];
            $response[$i]['age']=$row['age'];
            $response[$i]['email']=$row['email'];
            $i++;
        }
        echo json_encode($response,JSON_PRETTY_PRINT);
    }
    Else
    {
        Echo "database connection failed"
    }
}

?>
```

### REST API USING PHP

API clients -> curl, httpie, postman  
Used httpie on the commandline

Send request uri element from the server, to see the response from the page, take the command line using httpie and make a get request to that page ie; \$http get <http://localhost/index.php>

```
$("#loginbtn").click(function(event){  
    event.preventDefault();
```

```
    var username = $("#username").val();  
    var password = $("#password").val();
```

```
    $.ajax({  
        url: 'verify_user.php', // URL of the server-side script  
        type: 'POST',  
        dataType: 'json',  
        data: {  
            username: username,  
            password: password  
        },  
        success: function(response) {  
            // Handle the response from the server  
            if (response.status === 'success') {  
                alert(response.message);  
                // Redirect to the desired page after  
                successful login  
                window.location.href =  
                "homepage.html";  
            }  
            else {  
                alert(response.message);  
            }  
        },  
        error: function(xhr, status, error) {  
            // Handle any errors  
            console.error(error);  
            alert('An error occurred while logging in.');
```

Login.php

```
